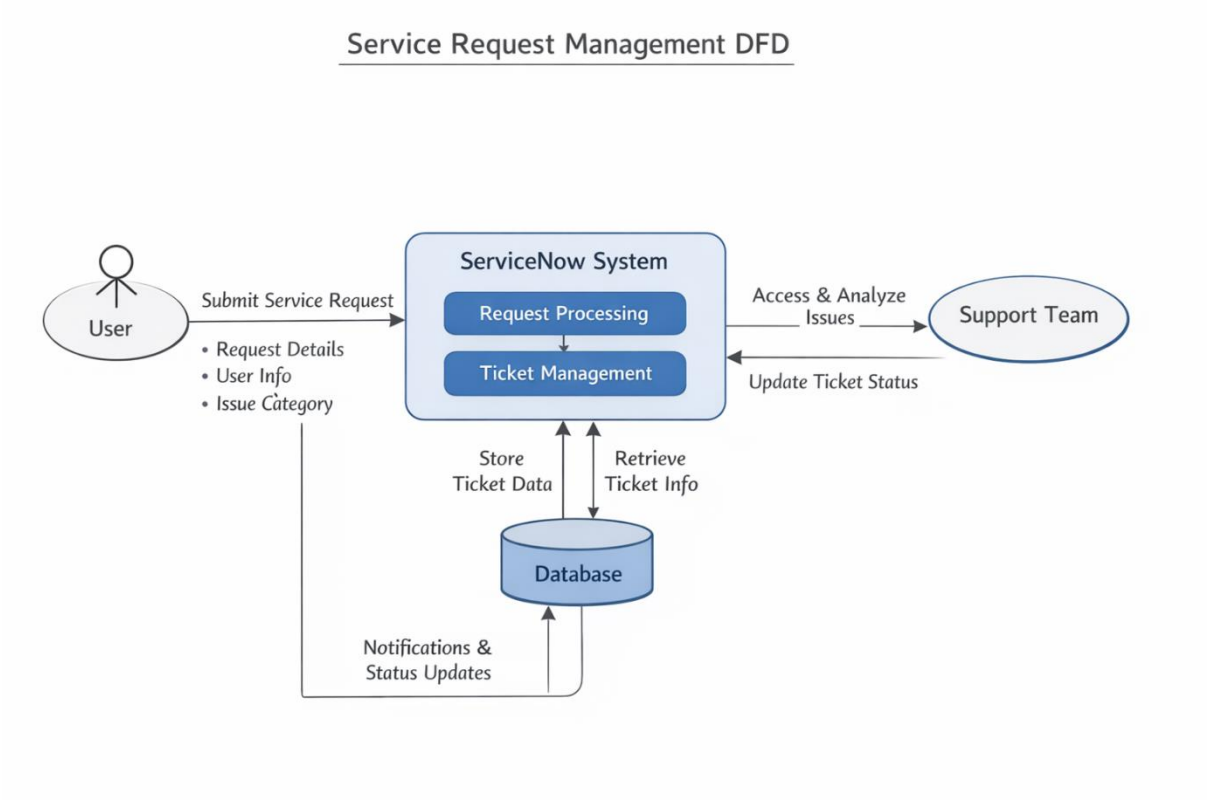
3. Data Flow Diagram (DFD)

A Data Flow Diagram (DFD) is used to represent how data moves within the system. It visually shows how information enters the system, how it is processed, and how it is stored or delivered as output. DFD helps in understanding the system structure and how different components interact with each other.

In this project, the data flow begins when the user submits a service request through the ServiceNow platform. The request details such as user information, issue description, and request category are sent to the system. The system processes this data and stores it in the database as a ticket.


The support team accesses the stored information, analyzes the issue, and updates the ticket status during the resolution process. The updated information is then communicated back to the user through notifications or status updates. The DFD helps in clearly understanding the movement of data between the user, the system, and the support team.
