1. Problem Solution Fit

Problem Solution Fit refers to the process of ensuring that the proposed solution effectively addresses the identified problem. In this stage, the development team analyzes whether the designed solution can solve the user's issues in an efficient and practical way. It helps in verifying that the system being developed meets the actual needs of the users.

In this project, the problem identified is the difficulty faced by users in managing and resolving service requests efficiently. Many organizations experience delays in handling issues due to manual processes, lack of proper tracking systems, and poor communication between departments. These challenges reduce productivity and increase user frustration.

To overcome this problem, the proposed ServiceNow-based system provides a structured platform where users can easily submit service requests and track their status. The system allows support teams to manage requests effectively, assign tasks to appropriate departments, and resolve issues quickly. By providing automation, better communication, and centralized data management, the solution fits well with the problem and ensures a more efficient service management process.
