2. Proposed Solution

The proposed solution describes the system or application that will be developed to solve the identified problem. It explains how the system will function and what features it will include to improve the current process.

In this project, the proposed solution is to develop a ServiceNow-based service request management system. This system allows users to raise service requests through a centralized platform where issues can be recorded, tracked, and resolved efficiently. The system simplifies the process of reporting problems and ensures that every request is properly managed.

The platform provides features such as ticket creation, request categorization, status tracking, and automated notifications. Once a user submits a request, the system automatically stores the data and assigns it to the appropriate support team. The support team can then analyze the issue, update the status, and provide a solution. Users can monitor the progress of their requests and receive updates until the issue is resolved. This solution improves transparency, reduces response time, and enhances overall service efficiency.
