3. Solution Architecture

Solution Architecture refers to the overall structure and design of the system. It explains how different components of the system interact with each other to deliver the required functionality. The architecture defines the flow of data, system modules, and the technologies involved in building the solution.

In this project, the solution architecture is designed around the ServiceNow platform. The system includes several components such as the user interface, application logic, and database. The user interface allows users to submit and track service requests through an easy-to-use portal. The application layer processes the requests, manages workflows, and assigns tasks to the support team.

The database component stores all the information related to service requests, user details, and ticket status. The system also includes notification mechanisms that inform users about updates and resolutions. These components work together to create a centralized and efficient service management system that improves communication and issue resolution within the organization.
