Streamlining Ticket Assignment for Efficient Support Operations

Problem Statement

ABC Corporation is a large technology organization that handles a high volume of customer support tickets daily. These tickets include issues such as login failures, system errors, certificate requests, and account expiration problems. Previously, the company relied on manual ticket assignment where support staff had to read each ticket and assign it to the appropriate support team. This manual process caused delays, misrouting of tickets, and inefficient utilization of support resources. As a result, customer issues were not resolved quickly, leading to reduced customer satisfaction and increased workload for support teams.

Objective

The main objective of this project is to implement an automated ticket routing system using ServiceNow. The system automatically assigns support tickets to the appropriate support groups based on the issue type. By automating ticket assignment, the organization can reduce resolution time, improve operational efficiency, and ensure that customer issues are handled by the correct team without manual intervention.

TASK INITIATION

Milestone 1 – Users

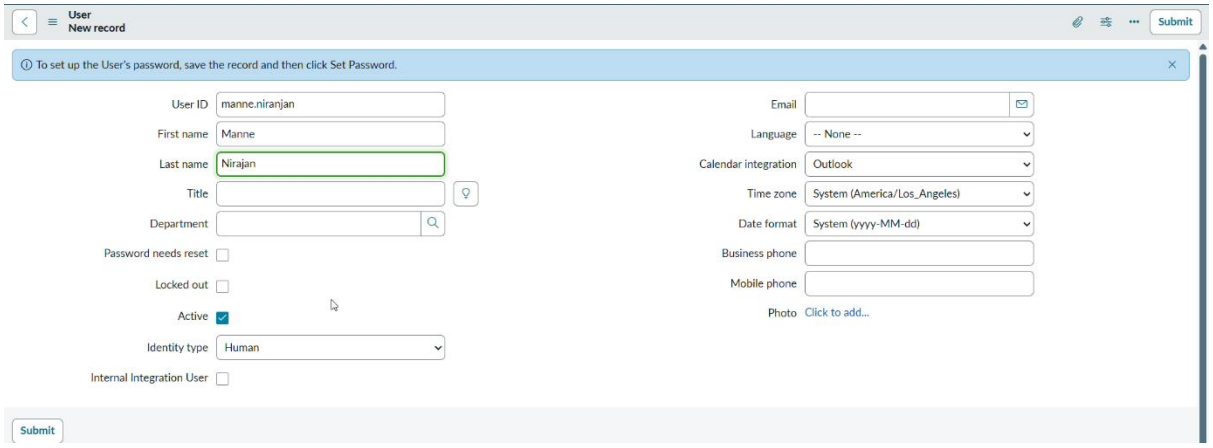
Activity 1: Create Users

Users represent individuals who interact with the system. In this project, users are created to represent support staff responsible for handling specific categories of support tickets.

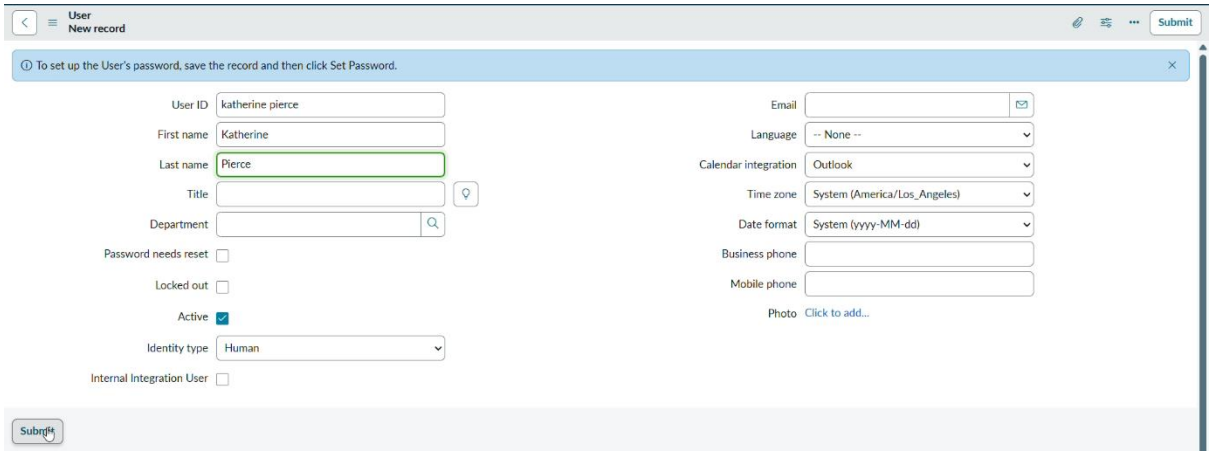
Steps:

1. Open the **ServiceNow platform**.
2. Navigate to **System Security → Users**.
3. Click on **New** to create a user record.
4. Enter details such as:
    - Name
    - Email
    - User ID
5. Click **Submit** to save the user.

Two users are created in this project to represent members of different support teams. These users will later be assigned to specific support groups to handle tickets related to their expertise.



Create one more user:



Milestone 2 – Groups

Activity 1: Create Groups

Groups are used to organize users based on their responsibilities or departments. In this project, groups are created to represent different technical support teams.

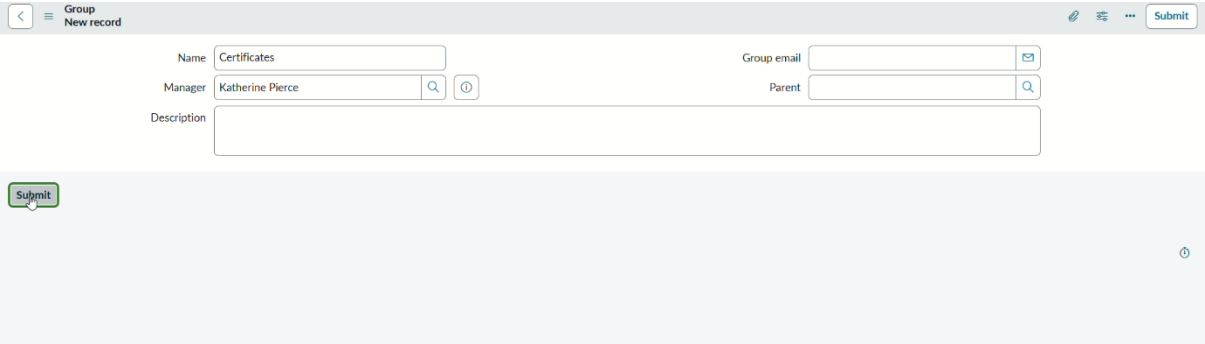
Steps:

1. Open **ServiceNow**.
2. Navigate to **System Security → Groups**.
3. Click **New** to create a group.
4. Enter group details such as:
    - Group Name
    - Description
5. Click **Submit**.

Two support groups are created:

- **Certificates Group** – Handles issues related to certificates.
- **Platform Group** – Handles platform-related technical issues.

These groups allow tickets to be automatically routed to the correct support team.



Milestone 3 – Roles

Activity 1: Create Roles

Roles define the permissions and responsibilities assigned to users in the system. Roles help control access to specific tables and functions in ServiceNow.

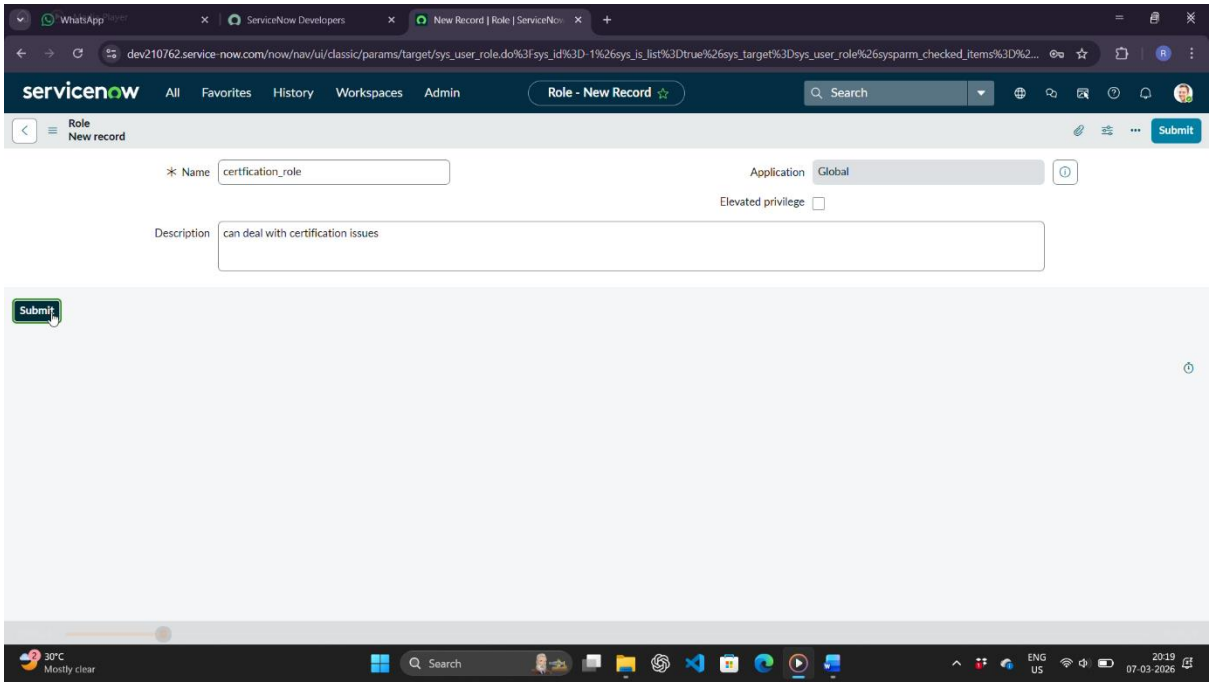
Steps:

1. Open **ServiceNow**.
2. Navigate to **System Security → Roles**.
3. Click **New**.
4. Enter the role name and description.
5. Click **Submit**.

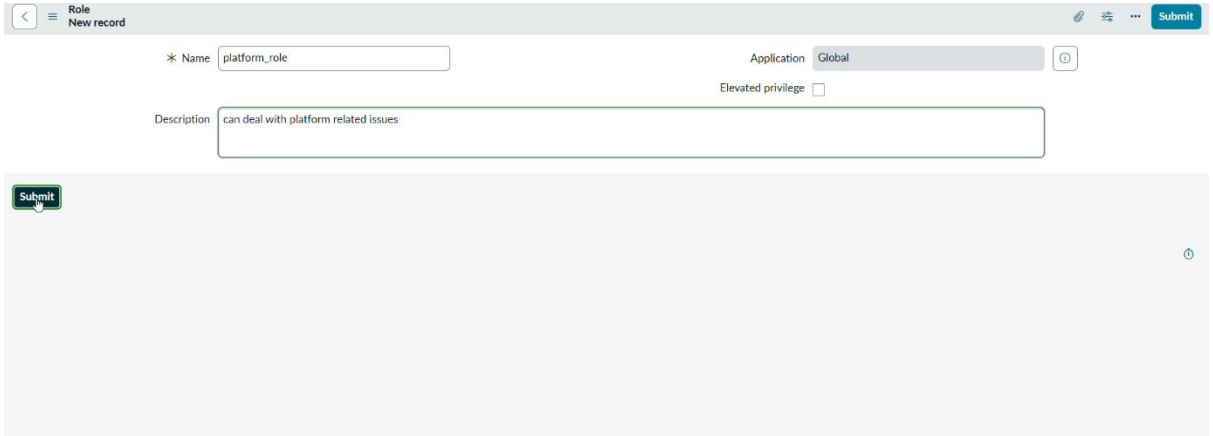
Two roles are created:

- **Certificate Role** – Allows access to certificate-related operations.
- **Platform Role** – Allows access to platform-related operations.

Roles ensure that only authorized users can access specific system functions.



Create one more role:



Milestone 4 – Table

Activity 1: Create Table

A custom table is created to store all support ticket information related to operational issues.

Steps:

1. Open **ServiceNow**.
2. Navigate to **System Definition → Tables**.
3. Click **New**.
4. Enter the following details:
    - Label: **Operations Related**

5. Enable options:
    - Create Module
    - Create Mobile Module
6. Add the required table columns.

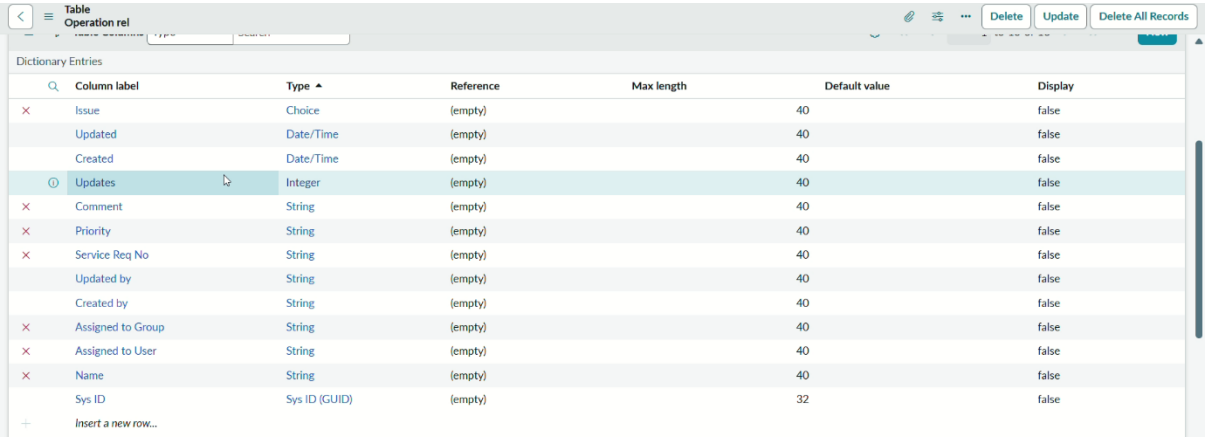
Important fields include:

- Ticket Number
- Issue Type
- Description
- Assigned Group
- Status

Choice values are also added to the **Issue field**, including:

- Unable to login to platform
- 404 error
- Regarding certificates
- Regarding user expired

These options help categorize tickets for automated routing.



Column label	Type	Reference	Max length	Default value	Display
Issue	Choice	(empty)	40		false
Updated	Date/Time	(empty)	40		false
Created	Date/Time	(empty)	40		false
Updates	Integer	(empty)	40		false
Comment	String	(empty)	40		false
Priority	String	(empty)	40		false
Service Req No	String	(empty)	40		false
Updated by	String	(empty)	40		false
Created by	String	(empty)	40		false
Assigned to Group	String	(empty)	40		false
Assigned to User	String	(empty)	40		false
Name	String	(empty)	40		false
Sys ID	Sys ID (GUID)	(empty)	32		false
Insert a new row...					

Milestone 5 – Assign Roles and Users to Groups

Activity 1: Assign Roles & Users to Certificate Group

Steps:

1. Open the **Certificates Group**.
2. Add the appropriate user as a **group member**.
3. Assign the **Certificate Role** to the group.

Activity 2: Assign Roles & Users to Platform Group

Steps:

1. Open the **Platform Group**.
2. Add the platform support user as a **group member**.
3. Assign the **Platform Role** to the group.

This ensures that each group has the right members and permissions to handle assigned tickets.

Milestone 6 – Assign Role to Table

To control who can access the Operations table, roles are assigned to the table permissions.

Steps:

1. Open the **Operations Related table**.
2. Navigate to **Application Access**.
3. Assign required roles for:
    - Read operation
    - Write operation

Roles added:

- Platform Role
- Certificate Role

This configuration ensures that only authorized users can view or modify ticket records.

Milestone 7 – Create ACL (Access Control List)

ACL rules define who can access specific fields or records in the table.

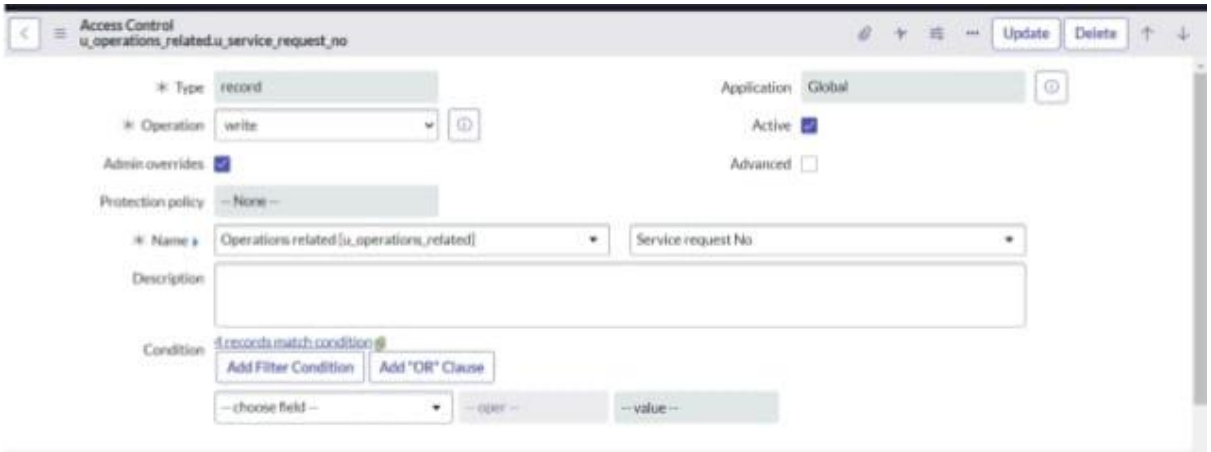
Steps:

1. Navigate to **System Security → Access Control (ACL)**.

2. Click **New**.
3. Specify:
    - Table Name
    - Operation (Read, Write, Create, Delete)
4. Add the required role.

Admin role is configured to manage secure access to the table and fields.

This improves system security and protects sensitive ticket data.



Milestone 8 – Flow Automation

Automation is implemented using **ServiceNow Flow Designer** to automatically assign tickets to the appropriate group.

Activity 1 – Flow for Certificate Issues

Steps:

1. Open **Flow Designer**.
2. Create a new flow named **Regarding Certificate**.
3. Select **Trigger: Create or Update Record**.
4. Choose the **Operations Related table**.
5. Set condition:
    - Issue = Regarding Certificates

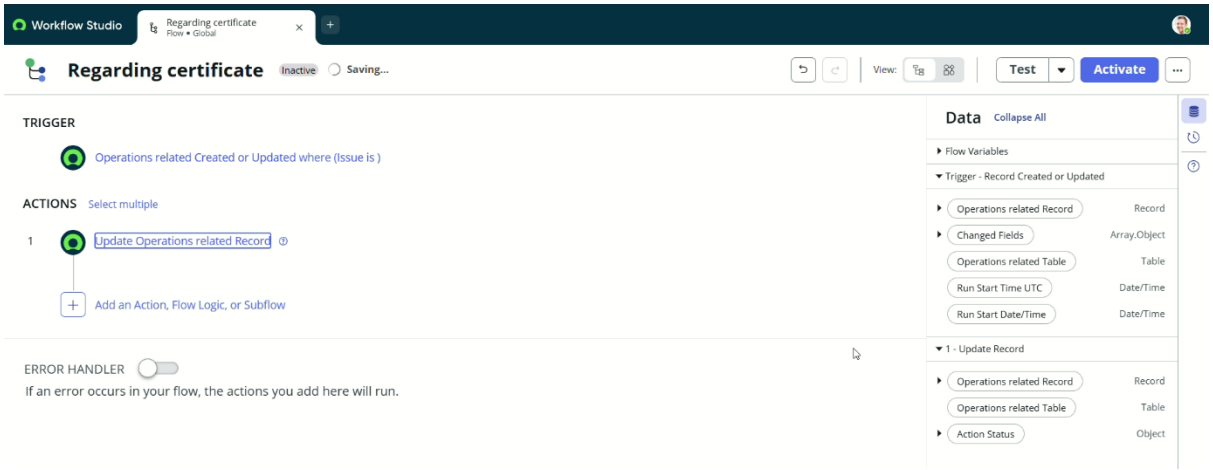
Action:

- Update record → Assigned Group = **Certificates Group**.

This flow ensures that all certificate-related tickets are automatically assigned to the certificate support team.



Activity 2 – Flow for Platform Issues

Steps:

1. Create another flow named **Regarding Platform**.
2. Set trigger:
    - Create or Update Record in Operations Related table.
3. Add conditions:
    - Unable to login to platform
    - 404 error
    - Regarding user expired

Action:

- Update record → Assigned Group = **Platform Group**.

This automation ensures platform-related issues are instantly routed to the platform support team.

Conclusion

The implementation of the automated ticket routing system significantly improves the support operations at ABC Corporation. By using ServiceNow features such as users, groups, roles, ACLs, custom tables, and Flow Designer, the system successfully automates ticket assignment based on issue type. This automation reduces manual effort, minimizes errors in ticket routing, and ensures that customer issues are addressed by the appropriate support team quickly. As a result, the organization benefits from improved operational efficiency, faster issue resolution, and enhanced customer satisfaction
