Project Title

Streaming Ticket Assignment for Efficient Support Operation

2. Objective

The objective of this project is to streamline and automate the assignment of support tickets in ServiceNow to improve efficiency in support operations.
This project ensures that incoming tickets are automatically assigned to the appropriate support group or agent based on predefined conditions, reducing manual effort and improving response time.

3. Tools / Platform Used

The following tools and technologies were used to implement the project:

- ServiceNow Developer Instance
- Incident Management Module
- Business Rules / Flow Designer
- Assignment Groups
- ServiceNow Tables (Incident Table)
- Form Configuration
- Workflow Automation

4. Steps / Methodology

Step 1: Requirement Analysis

First, the requirements for the ticket assignment process were analyzed. The goal was to automatically assign tickets to the correct support team based on ticket category or priority.

Step 2: Incident Table Configuration

The Incident table was used to manage incoming support tickets. Fields such as Category, Subcategory, Priority, and Assignment Group were configured.

Step 3: Creation of Assignment Groups

Different support groups were created in ServiceNow to handle various types of issues.
Examples:

- Network Support Team
- Software Support Team
- Hardware Support Team

Step 4: Automation Logic Implementation

Automation logic was implemented using **Business Rules / Flow Designer** to automatically assign tickets when they are created.

Example logic:

- If Category = Network → Assign to Network Support Group
- If Category = Software → Assign to Software Support Group
- If Category = Hardware → Assign to Hardware Support Group

Step 5: Form Configuration

The Incident form layout was configured to include important fields such as:

- Caller
- Category
- Priority
- Assignment Group
- Assigned To

This ensured proper data capture during ticket creation.

Step 6: Testing the Assignment Process

Multiple test incidents were created to verify that tickets were automatically assigned to the correct support group based on the configured rules.

5. Screenshots

The following screenshots were captured during the implementation:

- Incident Table Configuration
- Creation of Assignment Groups
- Business Rule / Flow Designer Setup
- Incident Form Layout
- Automatic Ticket Assignment Result

6. Result / Output

After implementing the automation logic, incoming tickets were automatically assigned to the appropriate support teams based on the ticket category.
This reduced manual intervention, improved ticket handling efficiency, and ensured faster response times for support requests.

7. Conclusion

This project demonstrates how ServiceNow can automate ticket assignment to improve support operations. By implementing automated workflows, organizations can reduce manual workload, ensure accurate ticket routing, and enhance overall service efficiency.
